

# Robots are just a catalyst shifting to new paradigm

([GLOBALINTELHUB](#)) – 3/11/17 –

The news, even the 'fake news' and 'alternative news' has been reduced to the bottom of the Maslow pyramid, personalizing things while dismantling the small amount of journalistic integrity that existed. The only next lower step is name calling "you are stupid-head, poopy face" or throwing food.

Liberals are angry that Trump won, Trump supporters are angry that liberals are so angry, blacks are angry because one of their own is out; women are angry because a "Man" is President, what's next? When will protests and holidays be labelled as big "Pity Parties" where protestors gather with psychologists and beat cotton dummies with rubber bats, all while wearing protective gear, monitored by 'government specialists' – I can see it now. It's an extension of the 'cry rooms' from Universities; sections of major cities can be closed for these 'necessary events' where angry people will get out their feelings in a controlled setting without damaging real property or getting themselves arrested. You think it's a big joke, do you – checkout these startups offering services to 'break things' for a fee: [The Smash Shack](#); [Anger Room – Relieve Stress & Anxiety | Anger Room™ | "Nothing You Expect, Everything You Deserve"](#)

Where is national coverage of these businesses – these guys need to get on Shark Tank there's a national need here. Parts of Detroit can be used for a mass destruction in controlled 'riots' like they did for the Zombie apocalypse trend.

Unfortunately it seems, that's just about all the unenlightened uneducated masses are good for, so you can't fault the globalists too much for trying to turn them into good worker consumer zombies.

There's a lot happening in the 'backoffice' of America, Inc. that we're seeing the surface of the big iceberg such as the Vault7 revelations, and more goodies to come. We're still catching up to previous data dumps such as the CIA releasing electronic access to a huge amount of records previously not online. [CIAs role in financial markets EXPOSED by documents release.](#)

What impact all this will have is unclear – what is clear is that we're on the precipice of a major paradigm shift, that from an 'old model' to a 'new model' speaking from the perspective of systems theory, which is really the best objective perspective. Robots are simply the catalyst ushering in the paradigm shift. The idea of 'manufacturing jobs' is widely misunderstood by luddites that populate the mainstream – they will have us believe that the idea of a resurgence in US manufacturing is a bad move, i.e. we're building the wrong economy, and reverting back to a 50s style system. But this just shows the lack of understanding on their part, the world has changed in the last 10 years, checkout this clip from leftist Bloomberg: [Trump's Plan to Bring Back Manufacturing Isn't Crazy – Bloomberg View](#)

*But there are plenty of other reasons to want to bring supply chains back to the U.S. High-value-added manufacturing – robot factories pumping out goods – creates jobs for Americans in other ways. As economist Enrico Moretti explains in his book "[The New Geography of Jobs](#)," high-tech manufacturing creates higher-paying service-sector jobs in a local area. The dollars that come into a town with a robot factory get spent on doctors and waiters and personal trainers, and the money circulates throughout the community, leaving everyone better off.*

*from another article:*

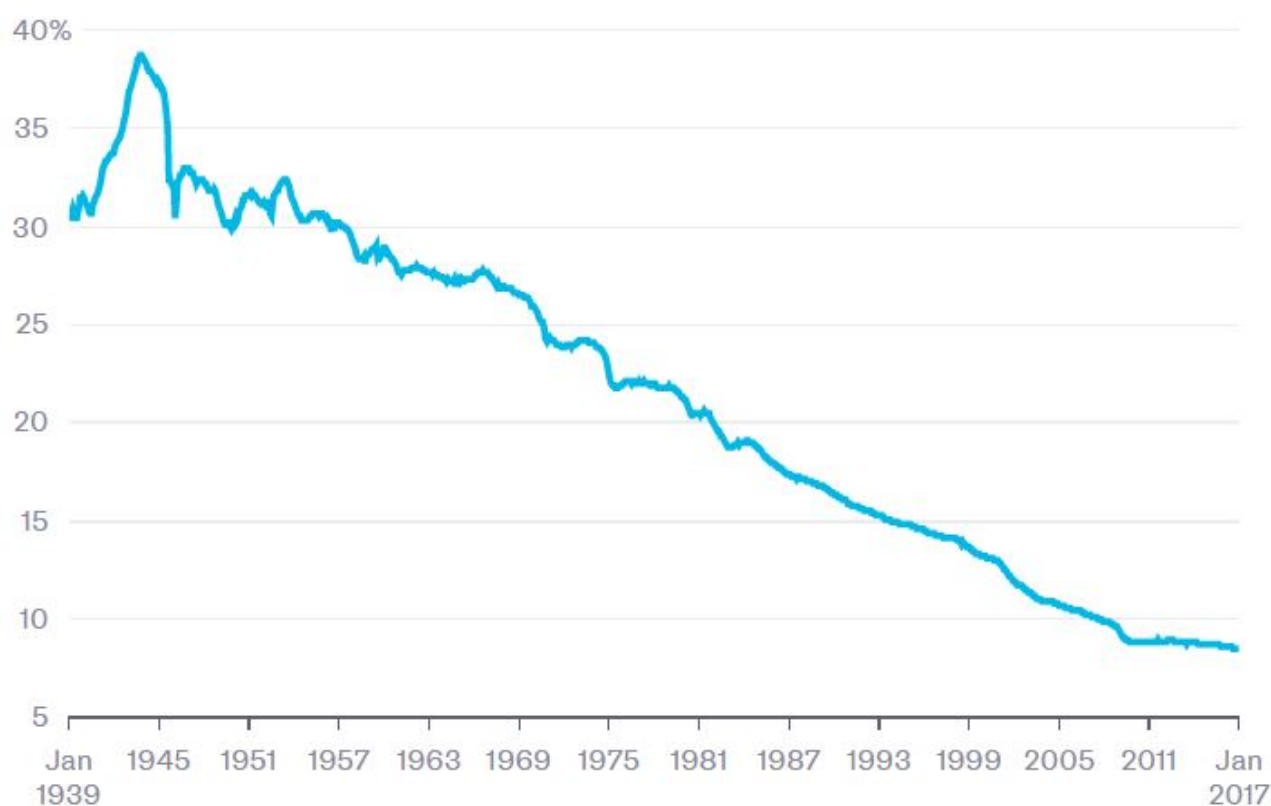

*Moretti demonstrates that there really are two Americas – one that's healthy, rich and growing, and a second that's increasingly being left behind. The two nations-within-a-nation are divided not so much by region or race or religion,*

*but by the kinds of industries they support. Those cities and towns that are home to innovative industries – information technology, pharmaceuticals, advanced manufacturing and the like – are wealthier, healthier and safer, while the places without these industries are steadily declining.*

Checkout this chart “Vanishing Blue Collars”:

## Vanishing Blue Collars

Share of U.S. work force employed in manufacturing.

Source: Federal Reserve Bank of St. Louis

The book fails to mention the fact that there were ALWAYS two Americas, USA was founded by a group of rich white male slaveowners who said all men are created equal. But the demographic trend away from manual labor exploitation is exemplified well, although the point here is not about booming tech centers vs. rural economic deserts – it’s about the changing world and how robots really are replacing mundane tasks. Those without skills in I.T. or computers will be left

unemployed or on the dole chronically. This is why – ahem – Republicans – ahem – you can never ever touch the welfare state, it's about a class of technologically redundant workers, white or black or latino all the same. You can't take away food stamps, medicaid, and other programs – these people are not going to be the innovators of tomorrow, and without food they'll simply riot and cause trouble – better keep them fat and happy and watching TV popping pills.

Seriously. And the good news – money can easily be printed and given to them at a very low cost (about .01 per \$100 electronically).

Robots are better, robots don't make mistakes, robots can go places man can't go (like inside Volcanoes, deep under the sea, and so on). Don't forget about software robots, that we speak about when talking about trading. Algorithmic trading is far superior to human trading – 10 years from now will anyone 'trade' their own account? Or they will just 'trade' robots – buy and sell various [algorithms that work well](#).

The point here is that what we are seeing is not a political trend at all. The Clinton 'pay for play' model of politics is outdated, they are cave-men banging their clubs and grunting around a fire. While Trump doesn't represent technology per se, he represents business – and as traders know, the market itself has an intelligence, maybe the markets are the first form of Artificial Intelligence. So what's going on is that the demographic shift is allowing a pro-business and thus pro-technology shift which will allow business and technology to thrive. In fact, the idea of 'politics' is outdated too – why can't all this be organized online – like the markets?

Because the 10% of the population that doesn't have computers? The good news is like the market, we've been proven, that intelligence finally wins; because what is unnatural cannot continue – if your car has no gas, you'll stop driving. Physics is really simple.

What's happening is a massive paradigm shift into a new

paradigm where the 'old model' is being transitioned to a 'new model' – this is seen in business, politics, medicine, education, construction, engineering, and basically all fields. The CIA was a product of World War 2, as eloquently explained here on Zero Hedge by Dr. Steve Pieczenik, the CIA was a byproduct of World War 2 and was created by real spies that had a real purpose, and it served its purpose well – against a real enemy (Hitler). (Of course, the CIA was created after the war but it was based on the spy network that fought Nazi Germany). Dr. Pieczenik notes intelligently that the current generation of Rockefellers, and would be world dictators are not interested in world domination or one world government plans created by their parents and grandparents.

The CIA, sort of died when its founders died; and the new generation turned it into something else – instead of serving the purpose for which it was originally intended, it was used to further special interests, build the business of the military industrial complex, and most recently influence domestic political elections. It's just another example of this old model vs. new model paradigm shift – it's become outdated, it should be closed.

The idea of a 'spy agency' needs to be re-evaluated in the context of modern society, where there are cameras everywhere and instantaneous global communications that are all recorded by NSA. Maybe a new, modern agency will be a team of trained analysts and 'hackers' commissioned for good purposes, such as monitoring electronic communications for crimes, terrorism, violent acts, and other behaviors to be stopped. In any case, whatever it looks like – one thing is clear – it will be run by robots, not humans.
